

## **TERAPIA IMMUNODEPRESSIVA (Induzione)**

We recommend starting a combination of immunosuppressive medications before, or at the time of, kidney transplantation. (1A)

We suggest including induction therapy with a biologic agent as part of the initial immunosuppressive regimen in KTRs. (2B)

We suggest using a lymphocyte-depleting agent, rather than an IL2-RA, for KTRs at high immunologic risk. (2B)
